1. Introduction

Women's safety is an important concern today. Women may face unsafe situations while travelling, working, studying, or moving around unfamiliar places. In an emergency, getting help quickly and contacting trusted people can be very important.

KAVACH is a women's safety website designed as a simple safety dashboard. It brings together emergency-related options such as an SOS button, trusted emergency contacts, safety status, location-sharing options, and a demo mode. The project aims to provide a convenient place where users can find and access these safety features.

The current version of KAVACH is a prototype. It demonstrates the website interface and its intended features. It should not be treated as a replacement for official emergency services or as a guarantee of real-time rescue.

2. Objectives

- To develop a simple and user-friendly website focused on women's safety.
- To provide an easily accessible SOS emergency option on the dashboard.
- To allow users to maintain a list of trusted emergency contacts.

- To display the user's safety status in one place.
- To include location-sharing options that can support communication during an emergency.
- To provide a demo mode for understanding and demonstrating the website's features.
- To create a foundation that can be improved with more advanced safety services in the future.

3. What Is Our Website About?

KAVACH is a web-based women's safety dashboard. Its main purpose is to bring useful safety options together in one interface. The dashboard is designed so that users can quickly identify the available options.

The main features included in the current prototype are:

- SOS Emergency Button: A prominent button provided for starting the emergency-alert process. Its actual alert delivery depends on the functions connected to the prototype.
- Trusted Emergency Contacts: A section for adding and managing the names and phone numbers of people the user trusts.
- Safety Status: A dashboard status area that helps the user view the current safety or activity status shown by the website.
- Location-Sharing Feature: A location section with map and GPS-related controls. Location access depends on browser permission and the device's location settings.
- Demo Mode: A demonstration option that helps users explore or present the website without treating the demonstration as a confirmed real emergency.

The website interface also displays other options, such as Guardian Timer, Fake Call, Stealth Mode, Safe Havens, and Incident Log. These should be described as additional modules only to the extent that they are implemented and tested in the current prototype. Any incomplete options are considered future development work.

4. Advantages

- Simple Dashboard: Important safety-related options are grouped in one place.
- Quick Access: The SOS option is clearly visible on the main dashboard.
- Contact Management: Users can keep trusted contact details available in the website.
- Location Awareness: The location section provides a starting point for location-related safety functions.

- Easy Demonstration: Demo mode can help explain the website during a project presentation.
- Scope for Improvement: The prototype can be expanded with additional features based on testing and user feedback.

5. Website Images and Link

The following screenshots show the main interface and the location and trusted-contact section of the KAVACH prototype.

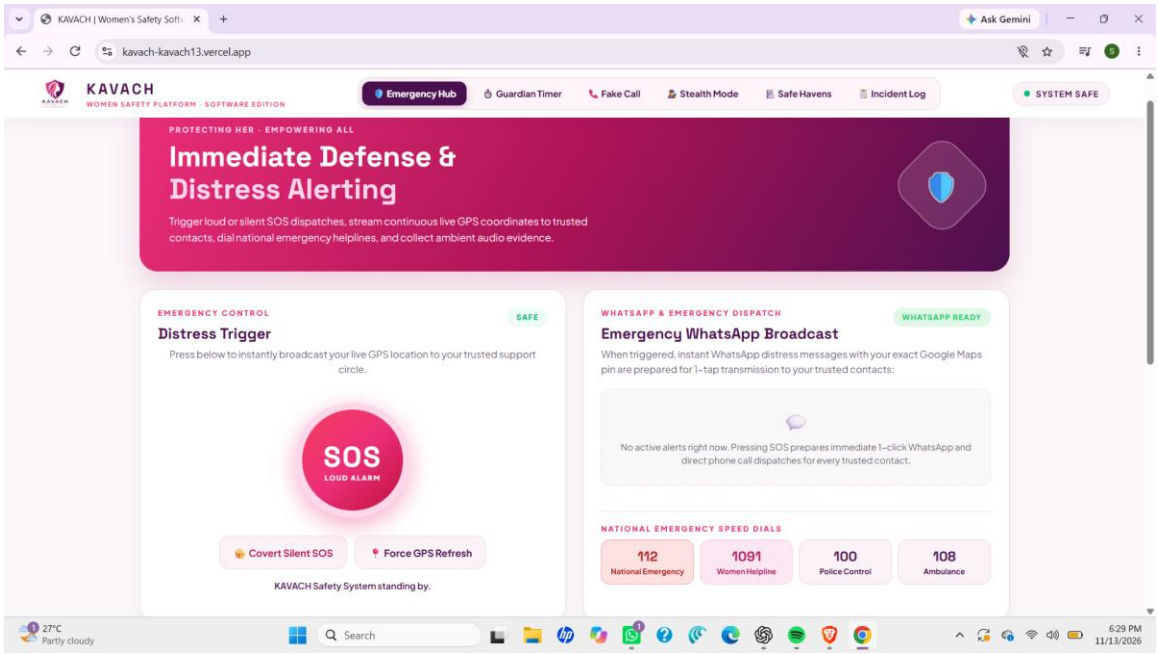

Figure 5.1: KAVACH Emergency Hub Dashboard

This screenshot shows the Emergency Hub dashboard. It displays the SOS emergency option and other emergency-related controls, including silent SOS, GPS refresh, WhatsApp broadcast, and emergency helpline information. These are interface options; their real-world operation must be verified through testing.

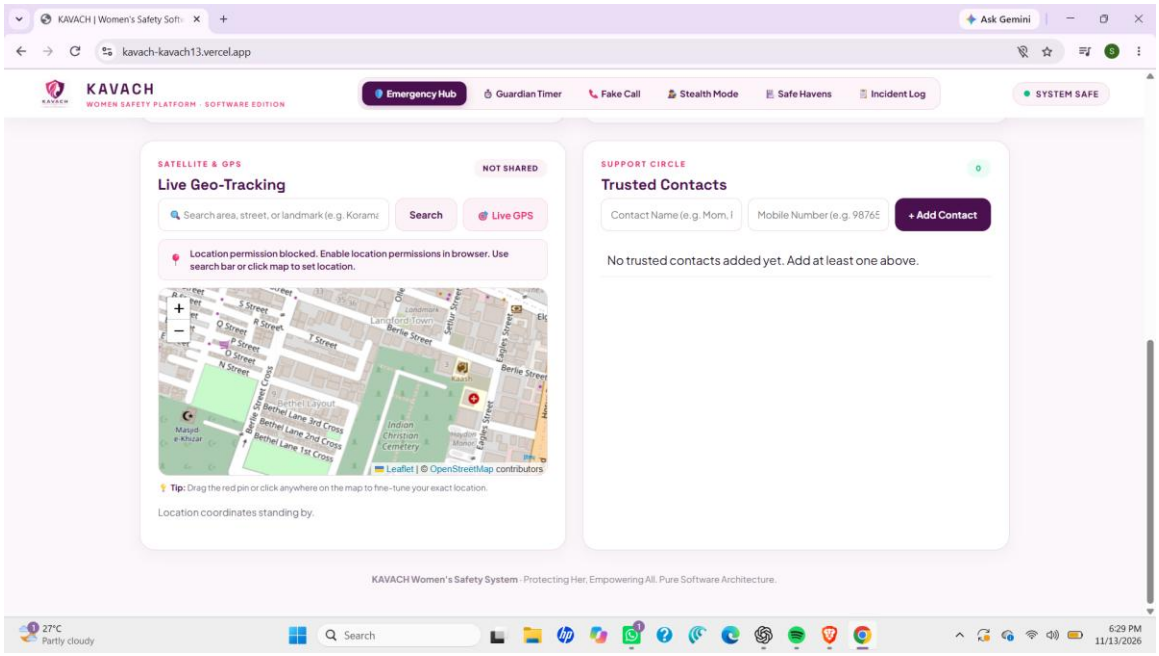

Figure 5.2: Location Tracking and Trusted Contacts

This screenshot shows the map and location controls, along with the trusted-contacts section. It includes options to use GPS and add contact details. In the screenshot, location permission is blocked and no trusted contacts are shown, so these functions should be tested with the required permissions and sample contact data.

6. Business Pitch Idea for Upcoming Features

KAVACH can be developed further into a more complete personal-safety platform. The future version can focus on reliable alert delivery, secure location sharing, and partnerships with trusted support services. The following ideas are proposed future developments and are not claimed as working features of the current prototype:

- Improved Live Location Sharing: Allow users to share their location with selected trusted contacts for a chosen period, with clear consent and privacy controls.
- Automatic Emergency Alerts: Explore an optional alert system that can notify selected contacts when a user activates an emergency function or misses a configured safety check-in.
- Guardian Timer: Add a check-in timer that can remind users to confirm that they have reached their destination safely.

- Verified Safe Havens: Provide information about verified nearby safe places, such as hospitals, police stations, and other approved support locations, after checking reliable data sources.
- Mobile Application: Develop an Android and iOS application for easier access and carefully tested notification features.
- Emergency-Service Integration: Explore formal partnerships with relevant authorities or support organisations. This would require approval, technical integration, and compliance with applicable rules.
- Privacy and Security Improvements: Use secure data storage, consent-based sharing, access controls, and clear data-deletion options to protect users' information.

Business model idea: A basic version of KAVACH could remain free for individual users. In the future, the project could explore optional paid plans for organisations such as colleges, hostels, and companies that want safety dashboards or group-support features. Partnerships and institutional subscriptions could help support maintenance and further development. Any paid service should be introduced only after the safety, privacy, and reliability of the features have been tested.

7. Conclusion

KAVACH is a prototype women's safety website that brings emergency options, trusted contacts, safety status, location-related controls, and demo functionality into one dashboard. The project demonstrates how a simple website can provide an organised interface for safety-related tools.

Although the current version is a prototype and some functions require further implementation and testing, it provides a useful foundation for future development. With improvements in reliability, privacy, location services, and emergency communication, KAVACH has the potential to become a more complete women's safety platform.
